Key Aspects of Automated Testing in Business Central

- Types of Tests in Business Central

Automated testing in Business Central encompasses several types, each serving different purposes:

- Unit Tests: Focused on testing individual functions or code units in isolation. They verify the correctness of specific logic, such as calculations or data manipulations.
- Integration Tests: Validate interactions between multiple components, modules, or external systems to ensure they work together as intended.
- UI Tests (End-to-End Tests): Simulate user interactions within the Business Central client or web interface to verify that the user experience functions correctly.
- Regression Tests: Re-run existing tests after changes to confirm that new modifications haven't broken existing functionalities.

- Tools and Frameworks for Automated Testing

Microsoft provides several tools and frameworks to facilitate automated testing in Business Central:

- AL Test Tool: Built into Business Central's development environment, AL Test Tool allows developers to write and execute unit tests directly within the AL language.

- AL Test Suites: Collections of individual tests organized for systematic execution, enabling comprehensive testing scenarios.
- Azure DevOps Pipelines: Integration with Azure DevOps enables automated build, test, and deployment workflows, supporting CI/CD practices.
- Visual Studio Code (VS Code) Extensions: With the AL Language extension, developers can author, run, and manage tests efficiently.
- Third-party Tools: Some organizations leverage additional testing frameworks or custom scripts, especially for UI automation.

Implementing Automated Testing in Business Central

- Writing Unit Tests with AL Test Framework

The foundation of automated testing in Business Central is writing unit tests using the AL language. Here's a step-by-step overview:

- Set Up Test Environment: Create a dedicated test codeunit, which is a special AL object designed to contain tests.
- Define Test Procedures: Each test method is annotated with `[Test]` and contains code to set up test data, execute the function under test, and verify outcomes.
- Use Assert Statements: AL provides `Assert` functions to validate expected results, such as `Assert.AreEqual`, `Assert.IsTrue`, or `Assert.IsNull`.
- Isolate Tests: Ensure each test is independent, with setup and teardown procedures to prepare the environment and clean up afterward.

Example:

```
``al
```

```
[Test]
```

```
procedure TestCalculateTotal()
```

```
var  
  
SalesLine: Record "Sales Line";  
  
TotalAmount: Decimal;  
  
begin  
  
    // Arrange  
  
    SalesLine."Quantity" := 10;  
  
    SalesLine."Unit Price" := 20;  
  
    // Act  
  
    TotalAmount := SalesLine.CalcLineAmount();  
  
    // Assert  
  
    Assert.AreEqual(200, TotalAmount, 'Total amount calculation failed.');
```

end;

...

- Creating Automated UI Tests

While AL supports unit testing within the development environment, UI automation often involves external tools such as:

- Cypress
- Selenium
- Microsoft Power Automate Desktop

These tools simulate user interactions like clicking buttons, entering data, and navigating screens, verifying that the user interface functions correctly across different scenarios.

- Integrating Automated Tests into CI/CD Pipelines

Automation is most effective when integrated into the deployment pipeline:

- Build Automation: Automatically compile and validate code upon check-in.
- Test Execution: Run unit and UI tests automatically on each build.
- Reporting: Generate reports highlighting test pass/fail statuses.
- Deployment: Proceed with deployment only if all tests pass.

Azure DevOps offers pipelines that support the entire process, with tasks configured to execute AL tests, deploy extensions, and run UI automation scripts.
