invasive species

Invasive species are organisms that are introduced to regions outside their native habitats and cause significant ecological, economic, or health-related problems. These species often outcompete native flora and fauna, leading to reduced biodiversity, altered ecosystems, and substantial economic costs. The global increase in invasive species is driven by human activities such as international trade, travel, and habitat modification. Understanding the nature of invasive species, their impacts, and strategies for management is crucial for protecting biodiversity and maintaining ecological balance.

What Are Invasive Species?

Invasive species are non-native organisms that establish, proliferate, and spread in new environments, often to the detriment of native species and ecosystems.
