- Provide clear instructions on completing the questionnaire
- Confirm that the respondent understands the time frame (past week)

### Instructions to Respondents

Participants are asked to rate each symptom based on how much it has distressed or bothered them

in the past week, using a 5-point Likert scale:

- Not at all
- Slightly
- Moderately
- Quite a bit
- Extremely

Encouraging honest and thoughtful responses enhances data accuracy.

## **Administration Modes**

The BSI can be administered via:

- Paper-and-pencil questionnaires
- Electronic formats (e.g., online surveys)
- Interview-based administration by trained clinicians

The choice depends on the setting and population.

## **Scoring the BSI**

### **Calculating Raw Scores**

Each of the 53 items corresponds to one of nine symptom dimensions:

- Somatization
- Obsessive-Compulsive
- Interpersonal Sensitivity
- Depression
- Anxiety
- Hostility
- Phobic Anxiety
- Paranoid Ideation
- Psychoticism

To score:

- Sum responses for each symptom dimension
- Calculate the Global Severity Index (GSI) by averaging all item responses

## Standardized Scores and Norms

Raw scores are often converted to T-scores using normative data to facilitate comparison across populations. The manual provides:

- Normative samples stratified by age, gender, and clinical status
- Cutoff scores indicating clinically significant distress

## Interpreting Scores

- Higher scores signify greater psychological distress
- Specific symptom dimension scores help identify targeted areas for intervention
- The GSI provides an overall measure of symptom severity

## Interpreting the Results
